

ABSTRACT OF THE DISCLOSURE

A fixed electrical connection member of an electronic device for connecting one or more electrical conductors of the electronic device to a mobile electrical connection member external to the electronic device includes, on the side external to the electronic device, $2N$ conductive terminals disposed on a front face and connected, inside the electronic device, to the electrical conductor of the electronic device, and aligned in pairs. The N pairs are aligned to form two rows of N terminals that are symmetrical with respect to a longitudinal axis. Each terminal of a pair is electrically connected to the terminal of the adjacent pair on the other side of the longitudinal axis.
